Northstar Digital Partners Inc

Proposal in response to Solicitation FA8771-27-R-0012 — Enterprise IT Modernization Services

Department of the Air Force

Volume I — Technical

1. Cloud Migration Methodology

Northstar applies a six-phase migration lifecycle — assess, plan, build, test, cut over and optimize — tailored to each application's architecture.

Assessment uses interviews with application owners and automated inventory scans. Applications are grouped into move groups by shared dependencies, and each move group follows a rehearsed cutover runbook.

Northstar has migrated more than 200 workloads across federal civilian and defense customers, with an average move-group duration of six weeks.

2. Cybersecurity and Authorization

Northstar's security engineers prepare the application security package, map inherited controls from the platform authorization, and support the authorizing official through the assessment and authorization process for each application.

Our team includes Certified Information Systems Security Professionals who have supported more than 40 Air Force authorization packages to an initial ATO decision.

3. Legacy Application Rationalization

Northstar will conduct a portfolio review in the first 90 days that recommends a disposition for each application: rehost, replatform, refactor, replace or retire.
