RESTRICTION ON DISCLOSURE AND USE OF DATA (FAR 52.215-1(e))

This proposal includes data that shall not be disclosed outside the Government and shall not be duplicated, used, or disclosed — in whole or in part — for any purpose other than to evaluate this proposal. If, however, a contract is awarded to this offeror as a result of — or in connection with — the submission of this data, the Government shall have the right to duplicate, use, or disclose the data to the extent provided in the resulting contract. This restriction does not limit the Government's right to use information contained in this data if it is obtainable from another source without restriction. The data subject to this restriction are contained in all pages of this volume.

1. Predictive Maintenance Analytics

Keystone will deliver predictive maintenance models for ground vehicles and generators that forecast component failures 30 to 90 days ahead. The models were trained and validated on three years of Army ground-fleet maintenance history, and in a 2025 pilot with an Army sustainment brigade they cut unscheduled maintenance by 18 percent.

Every model publishes its accuracy, drift and the data it was trained on to a model registry, so maintainers can see why a part was flagged before acting on it.

2. Data Integration with GCSS-Army

The platform exchanges data with GCSS-Army in both directions through the Army's approved interface, and this integration is already authorized under an Army RMF package from our current task order. Legacy STAMIS feeds are mapped into the same data model during transition.

Units that operate disconnected keep a local analytics node that synchronizes when the network returns, so forecasts remain available in the field.

3. Cybersecurity and RMF

Keystone will inherit controls from the Army cloud environment and implement the remaining controls before the platform carries production data, with continuous monitoring evidence fed to eMASS.
